OREBiT Chat and Rain

Code audit and fixes - Batch 1 of 5 issues

BATCH 1 COMPLETE - 5 issues addressed in the local source snapshot

Audit date: 2 November 2026. Scope: the first five high-priority rain items from OREBIT-CHAT-RAIN-FIXES.html (N-001 to N-005), compared against the current user-backend code and migrations.

Issue-by-issue record

N-001 | P0 CRITICAL | Rain SQL used columns absent from the migrations

WHAT WAS WRONG	WHAT CHANGED
Configuration reads and schedule/lock queries named columns such as config, currency, pot_minor, locked_by and locked_at. The migrated schema uses document, next_currency, next_pot_minor, next_pot_usd_minor, lock_owner and lock_until.	Updated rain configuration reads/writes to document. Mapped schedule fields to the migrated next_* columns, and changed lock acquisition/release to use lock_owner and lock_until.
Result: Settings and schedule queries now match the schema created by the migration set.	**Code:** src/social/rain/rain.dboperation.ts; db/migrations/20261020120000_rainpool/migration.sql; db/migrations/20261021120000_rainpool_spec_alignment/migration.sql

N-002 | P0 CRITICAL | Saving a rain omitted required recipient_count

WHAT WAS WRONG	WHAT CHANGED
rain.runs requires recipient_count, but insertRun omitted it. The database would reject the row and roll back the associated wallet transaction.	Added recipientCount to insertRun and pass run.shares.length at user, system and repeat payout call sites.
Result: Each persisted run records the actual number of paid shares.	**Code:** src/social/rain/rain.dboperation.ts; rain.service.ts; rain.scheduler.service.ts; rain.series.service.ts

N-003 | P0 CRITICAL | Paid recipients were not written to rain.recipients

WHAT WAS WRONG	WHAT CHANGED
The three completed payout paths inserted a run and moved wallet balances, but did not call insertShares. Later alerts, history, rewards and reversals therefore saw no recipient rows.	Added insertShares in the same transaction as insertRun and wallet movement for user rain, scheduled system rain and repeat rain.
Result: A committed payment now has its recipient rows committed atomically with the run and ledger legs.	**Code:** src/social/rain/rain.service.ts; rain.scheduler.service.ts; rain.series.service.ts; rain.dboperation.ts

Issue-by-issue record (continued)

N-004 | P0 CRITICAL | Whole-rain revert treated null recipients as an empty list

WHAT WAS WRONG	WHAT CHANGED
A whole revert passed null, which the service converted to []. The query selected nobody, so no shares were reverted. The prior NONE policy could also debit recipients and credit the platform.	Null now selects all unreversed shares; an explicit ID list still selects only those users. For user rains with payerRefund=NONE, reversalPlan creates no money legs; the shares are recorded as processed with zero reclaimed.
Result: Whole-rain selection works, and the NONE option moves no funds from recipients to the platform.	**Code:** src/social/rain/rain.revert.service.ts; rain.revert.dboperation.ts; rain.math.ts

N-005 | P1 HIGH | Reverts could select already reversed shares and leave zero-reclaim shares open

WHAT WAS WRONG	WHAT CHANGED
takeShares ignored reversed_at. Shares with no available balance were not written to the reclaimed map, so their rows stayed open; repeated reverts could retry the same debit.	takeShares now filters reversed_at IS NULL. Reclaim updates record every selected share, including amount zero, and store reversed_job_id. The run lock and this filter prevent already-processed shares from being taken again.
Result: A zero-balance recipient is marked processed, and repeat reverts see only shares still open.	**Code:** src/social/rain/rain.revert.dboperation.ts; rain.revert.service.ts; tests/social/rain.db.spec.ts

Validation

Check	Result
TypeScript typecheck	PASS - npm run typecheck
Rain money arithmetic tests	PASS - 27 tests, including NONE does not move funds
Migrated PostgreSQL rain regression tests	PASS - 3 tests on a scratch database after all 61 migrations

Scope note: This batch addresses N-001 to N-005 only. The earlier standalone TypeScript type mismatch was fixed before this batch and is not counted here. Other report items remain unaudited/unfixed in this batch.

Repository note: These edits are in the local backend source snapshot. They have not been pushed to GitHub; the pushed my-trading-system/index branch currently contains only README.md.

Sources: OREBIT-CHAT-RAIN-FIXES.html (N-001 to N-005); user backend rain source and migrations; tests/rain.math.spec.ts and tests/social/rain.db.spec.ts.
